## Basic Transformations and Algebraic Rules

## General Rules

(-) means sign of coordinate is changed. Usually means a reflection.
A coefficient other than 1 means a dilation.
Swapping positions of $x$ and $y$ means either a reflection or a rotation

Example: $(\mathrm{x}, \mathrm{y}) \rightarrow(-\mathrm{x}, \mathrm{y})$
$x$-coordinate's sign is changed.
Results in a reflection over the $y$-axis.

Example: $(\mathrm{x}, \mathrm{y}) \rightarrow(5 \mathrm{x}, 5 \mathrm{y})$

Both $(+)$ or $(-)=$ reflection

One (+), one (-) = rotation

Both coordinates are multiplied by 5. This results in an enlargement by 5 .

Reflection over line $y=x$
Example: $(x, y) \rightarrow(-y, x)$ $90^{\circ}$ rotation

| Translations |
| :---: |
| Translate by vector $\langle a, b>$ |
| $(\mathbf{x}, \mathbf{y}) \rightarrow(\mathbf{x}+\mathbf{a}, \mathbf{y}+\mathbf{b})$ |
|  |

| Reflections |  |
| :---: | :---: |
| $(x, y) \rightarrow(x,-y)$ | Reflect over x-axis |
| $(\mathrm{x}, \mathrm{y}) \rightarrow(-\mathrm{x}, \mathrm{y})$ | Reflect over y-axis |
| $(\mathrm{x}, \mathrm{y}) \rightarrow(-\mathrm{x},-\mathrm{y})$ | Reflect over both axes (same as a $\mathbf{1 8 0}^{\circ}$ rotation) |
| $(\mathrm{x}, \mathrm{y}) \rightarrow(\mathrm{y}, \mathrm{x})$ | Reflect over line $y=x$ |
| $(x, y) \rightarrow(-y,-x)$ | Reflect over line $y=-x$ |

| Rotations |
| :---: |
| $90^{\circ}$ rotation (counter-clockwise) $(x, y) \rightarrow(-y, x)$ |
| $180^{\circ}$ rotation (same as a reflection around both axes) $(x, y) \rightarrow(-x,-y)$ |
| $270^{\circ}$ rotation (counter-clockwise) $(x, y) \rightarrow(y,-x)$ |
| $\begin{aligned} & 360^{\circ} \text { rotation } \\ & (\mathbf{x}, \mathbf{y}) \rightarrow(\mathbf{x}, \mathbf{y}) \end{aligned}$ |

| Dilations and Stretches/Shrinks |  |
| :---: | :---: |
| $(\mathrm{x}, \mathrm{y}) \rightarrow(\mathbf{a x}, \mathrm{ay})$ | Dilate by factor $a$, Centered on the origin. <br> $a>1$ means enlarged <br> $a<1$ means shrunk |

## Basic Transformations and Algebraic Rules
